WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports (Form 86ab) rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is promptly requested and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per 1000 mean strength which would occur over a year's time if the current week's experience continued through the year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases of the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per 1000 strength, as given in this report, furnishes an approximation to the current non-effective rate. The mean number of non-effectives per 1000 strength is given in the summary table for the total United States and for each of the Service Commands.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds currently reported as "expansion beds", beds in dispensaries, convalescent facilities, venereal disease facilities and college training detachments are not included in this report.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of (by death, return to duty, transfer, or otherwise) during the week, the number of such patients remaining at the end of the week, and corresponding data for battle casualties.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) has been placed after admission rates computed on the basis of 5 or fewer cases.

The symbol # has been placed after the names of stations (or groups of stations) where part or all of the data for the current week has not been received and the latest available figures have been substituted.

WEEKLY HEALTH REPORT

WEEK ENDING 20 NOVEMBER 1943

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated in the chart on page 3, the admission rates from all causes and from all diseases combined both increased markedly during the week ending 20 November 1943, reflecting largely a very sharp increase in the admission rate from colds, influenza, etc. Despite this very sharp increase, the current week's admission rate from colds, influenza, etc. remains about 40 percent below that prevailing during the corresponding week of 1942, while the current week's admission rates from all causes and from all diseases combined are nearly 7 percent under those during the corresponding week last year.

The somewhat late seasonal rise in the admission rate from colds, influenza, etc. (which first began to manifest itself in the week ending 13 November) has finally lifted the annual admission rate from all causes above the 700 per thousand mark, below which level it had consistently fluctuated since the early part of September.

VARIATIONS IN MORBIDITY BY SERVICE COMMAND

During the week ending 20 November 1943 there were very large increases in the admission rates from all causes and from all diseases combined in the Sixth Service Command, the Military District of Washington, the Seventh Service Command, the Third Service Command, and the Second Service Command, and smaller increases in the First, Fourth and Ninth Service Commands. These increases reflect chiefly the sharp increases in the admission rate from colds, influenza, etc. The very high rates of admission from all causes and from all diseases combined in the Sixth Service Command reflect an annual rate of admission from colds and influenza of over 350 per 1000.

VARIATIONS IN MORBIDITY BY STATIONS

The table on page 24 shows the six stations (having a strength of 5000 or over) which reported the highest morbidity rates from certain causes. The excessively high rates from all causes and from all diseases combined are more apparent than real since in several instances they reflect the reporting of venereal diseases existing prior to induction among selectees accepted with uncomplicated cases of venereal disease. More significant, therefore, of high morbidity from disease are the rates of admission from disease excluding venereal EPTI cases.

CURRENT HOSPITALIZATION CONDITIONS

The total bed capacity increased to more than 355,000 on 20 November 1943. The number of beds occupied on that date was nearly 188,000 and the number of "available vacant" beds almost 98,000. There were 25 stations with a total bed capacity of about 22,000 which had no "available vacant" beds; included among them were 8 general hospitals with a bed capacity of over 13,500 beds.

On 20 November 1943, there were 1,921 cases of malaria remaining under treatment, all but 23 of which were presumably acquired outside of the United States. The number of neuropsychiatric cases re-

RESTRICTED

SUPPLEMENTARY HEALTH REPORT

FOR THE FIVE WEEK PERIOD ENDING 30 OCTOBER 1943

COMMENT ON RECENT DEVELOPMENTS

MORBIDITY FROM ALL CAUSES: DISEASE AND INJURY

During the five week period ending 30 October 1943 the admission rates from all causes and from all diseases combined fell to the lowest level reported this year, which was approximately the same as in October 1942. The admission rate from injury decreased slightly as compared with the immediately preceding months and stood at the relatively low level of 82 per thousand strength.

All Service Commands except the First and the Military District of Washington had admission rates from all causes and from all diseases combined within 10 percent of the rate for the continental United States as a whole. The two above-mentioned exceptions had rates of only about 500 per thousand strength, or approximately 25 percent below the average for the continental United States as a whole. The Military District of Washington because of the character of the troops comprising its strength had by far the lowest admission rate from injury, or only about one-half that for the country as a whole.

RESPIRATORY CAUSES

During October the admission rate from colds, influenza, etc. was slightly below 100 per thousand strength, or about the same as it had been during the preceding three months, and about 35 percent below the level for the corresponding period in 1942. The highest morbidity for these causes was registered in the Second and Fifth Service Commands, while the Eighth and Ninth Service Commands had the lowest rates. Morbidity from pneumonia (including atypical) has shown the same general trends as that for colds, influenza, etc., although on a level only about one-tenth as great. Atypical pneumonia has continued to represent almost one-half of the total pneumonia cases.

DIARRHEA AND DYSENTERY

Morbidity from diarrhea and dysentery for the total United States showed the normal seasonal decline, being reported in October at about 10 per thousand strength which represented a decline of about 40 percent from September. Morbidity from this cause was reported to be relatively high, however, in the First, Second, and Fifth Service Commands as a result of several minor outbreaks.

VENEREAL CAUSES

The admission rates from all venereal diseases, excluding EPTI cases, decreased in October to a level of about 26 per thousand strength, which is somewhat above the rates prevailing during the early part of this year. This decrease resulted primarily from the decline in the morbidity from gonorrhea. The morbidity represented by venereal EPTI cases was reported in October at 24 per thousand strength, the highest rate so far. This is believed to be due to larger numbers of selectees with venereal diseases coming up

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

for induction. The morbidity from all venereal diseases including EPTI cases has shown an upward trend, reaching a new high of 50 per thousand strength in October, because of the increase in venereal EPTI cases.

NEUROPSYCHIATRIC DISORDERS

The morbidity rate reported from neuropsychiatric disorders has been on about the same level in August, September and October (48 per thousand strength) which is the highest reported to date. The admissions to locked wards have represented only about one-quarter of the total admissions. It should be noted that the reported admission rates from neuropsychiatric disorders probably overstate the actual admission rates to the extent that cases admitted to a station hospital and then transferred to a general hospital may in many instances be included twice. The admission rate for the total United States for all stations excluding general hospitals was only 29 per thousand strength in contrast with a rate of 48 per thousand strength when general hospitals are included.

MEASLES, MUMPS, AND SCARLET FEVER

The admission rates for these causes have continued on the relatively low level expected during this time of the year. About 60 percent of the cases of measles were in the Fourth Service Command (and more than half of these were at Fort Benning, Ga.), while more than 40 percent of the cases of mumps were in the Ninth Service Command.

MENINGITIS

In October the morbidity from this cause was at the relatively low level of .3 per thousand strength, or about the same as in September (and the same as during the major part of 1942) but considerably below that in the early months of 1943, when a marked epidemic was reported.

RHEUMATIC FEVER

Morbidity from this cause in October continued on the same level as in September, which was considerably below the relatively high levels attained during the spring months of 1943. Nevertheless, the recent morbidity from this cause has been several times as high as that reported during most of 1942. More than half of the cases reported in October occurred in the Seventh Service Command.

TUBERCULOSIS

Morbidity from this cause continued on about the same level as has persisted since the middle of 1942.

MALARIA

Morbidity from this cause when properly sub-divided to indicate the cases presumably acquired outside of this country shows a relatively low level, namely .2 per thousand strength for malaria acquired in the United States. On the other hand, malaria acquired outside the United States constituted about

COMMENT ON RECENT DEVELOPMENTS (CONT'D)

90 percent of the total cases reported in October and continued to show an upward trend as the result of more troops being returned to this country from malarious areas.

MORTALITY

The mortality rate from all causes continued on about the same level as that prevailing during the greater part of this year. The mortality rate from injury which accounts for approximately 80 percent of the mortality rate from all causes has likewise been on about the same level as in previous months. The mortality from disease registered the low rate of .4 per thousand strength for the second successive month. This rate is definitely the lowest ever attained; compared with the corresponding period of 1942, current mortality from disease is about 40 percent lower. All service commands showed low mortality from disease, but the Military District of Washington had the relatively high rate of 1.5 per thousand strength due chiefly to its older age constitution.
